WeaveCube - two worked examples

Paper: 10.5281/zenodo.22846520

IMPORTANT: these are different experimental configurations - not stages of one execution.

A. Mechanism example - A18 Case 0

Planted-positive 5+5 diagnostic: progressive exact restriction

Conceptual relation 577,368 x 577,368 = 333,353,807,424

Only after <= 64 pairs: materialize 19 -> replay 9 -> witness

`B L2 D L' B' U2 F2 D' F B2`

Full-Q replay: PASS

Fixed-order control: 9 conditions -> 30 pairs -> 24 replays; same witness.

Interpretation: one concrete example that ordering changes restriction work. Not evidence of general coverage, completeness, or scalability.

B. Operational example - FULL-24 Case 1

Frozen v37.153/v37.527 path: one concrete replay-verified solution

25-move sealed scramble

`F' U2 R D R D' L D L' R' L R' B2 U2 B2 L F2 D2 F U' D U' F' D B`

Root	phase-1 LB = 8
Front-end portfolio	H = 11; 82,554 prefix nodes; 240 endpoints
Exact completion	K2 = 11; 207 terminal calls; certified
Complete solution	22 moves
Verification	native replay PASS + independent 54-sticker replay PASS

Front-end H=11

`D2 L2 F' L' U D2 L' R' D' R2 L`

Completion K2=11

`F2 U F2 U' R2 D2 L2 F2 U2 R2 D2`

Interpretation: this specific frozen configuration produced a concrete valid solution. It does not establish arbitrary-state reliability, optimality, short solutions, scalability, or competitiveness with mature solvers.
